

Whisher's offer to ISPs

Whisher is a software based service bringing together the strength of residential and commercial hotspots.

Whisher cooperates with ISPs in order to customize its solutions to their specific needs. The ISP can thus distribute a white label version of Whisher to his subscribers.

Main features of Whisher for ISPs

Shared hotspots

Create and control a **residential WiFi hotspot network** based on the aggregation of the WiFi connections of its subscribers. The ISP has full flexibility to setup access rules to this network:

- This network can be limited to ISP subscribers
- The access can be free for the subscribers and subject to a fee for non-subscribers.

Commercial hotspots

Offer worldwide access to commercial hotspots. The plug-in allows the user to connect automatically, without the hassle of going through a login process, specific to each different provider. A single credit gives access to all the different hotspots. In addition to that, information about the availability of commercial networks and their price is displayed through the client.

In case of an ISP acting also as a commercial WISP, products and price plans can be integrated in the Whisher system. User will have the same experience connecting at home, in a residential WiFi hotspot or at commercial hotspots

How does it work?

A single plug-in does it all!

- The end user installs the Whisher plug-in on his PC. He can in a few clicks register his WiFi for sharing with other users
- The native WiFi manager of the user has been upgraded and allows connecting not only at home, but also to all other shared networks and to commercial hotspots. It also enables the user to control the sharing of its personal network

No network upgrade or firmware update is needed. Everything is done through the subscriber's client.

What are the advantages for my subscribers?

- *Global Connectivity:* The combination of residential and commercial networks offers a unique network for the subscribers
- *Simplicity:* As Whisher is developed as a plug-in, the user doesn't have to change his connection habits to use the increased coverage
- *Mobile:* Whisher also exists for WiFi enabled Nokia phones and enables an easy login to all hotspots

What are the advantages for me as an ISP?

- *Improved offering:* Creation of an ISP Hotspots network
- *Easy integration:* As Whisher is a software based solution, it can easily be integrated in the existing setup process
- *Flexibility:* Hardware independent solution (compatible with all routers)
- *Financials:* Low cost of integration compared to a hardware based solution, no firmware development needed
